

**Amendments to the Claims:**

**Listing of Claims**

This listing of claims replaces all prior versions and listings of claims in the present application.

1. (Original) An actuator device self-contained within a housing and adapted to move an object, the actuator device comprising:

a movable piston positioned in a cylinder portion of the housing, the cylinder portion defining a longitudinal axis, the piston being movable along the longitudinal axis in response to an accumulation of air pressure within the cylinder portion;

a rod coupled to the piston for movement with the piston, the rod at least partially extending outside of the housing to couple to the object; and

an air compressor located within the housing, the air compressor transferring air from a location in the housing outside the cylinder portion to a location inside the cylinder portion.

2. (Original) The actuator device of Claim 1, further comprising a valve selectively fluidly connecting the location inside the cylinder portion and the location in the housing outside the cylinder portion.

3. (Original) The actuator device of Claim 2, wherein the valve selectively fluidly connects the location inside the cylinder portion and the location in the housing outside the cylinder portion to vent the air pressure from the cylinder portion.

4. (Original) The actuator device of Claim 2, wherein the valve comprises a solenoid valve selectively actuated by an electrical power source.

5. (Original) The actuator device of Claim 4, further comprising a switch selectively electrically connecting the solenoid valve and the power source.

6. (Original) The actuator device of Claim 1, further comprising a main power switch electrically connected with a power source; and a limit switch positioned within the housing adjacent the piston such that selective movement of the piston triggers the limit switch, the limit switch selectively electrically connecting the air compressor and the main power switch, wherein the main power switch selectively electrically connects the air compressor and the power source to operate the air compressor.

7. (Original) The actuator device of Claim 1, wherein the rod is integrally formed with the piston.

8. (Original) An actuating system comprising:

an actuator device self-contained within a housing, the actuator device including  
a movable piston positioned in a cylinder portion of the housing, the  
cylinder portion defining a longitudinal axis, the piston being movable along the  
longitudinal axis in response to an accumulation of air pressure within the cylinder  
portion,

a rod coupled to the piston for movement with the piston, the rod at least  
partially extending outside of the housing to couple to the object, and  
an air compressor located within the housing, the air compressor  
transferring air from a location in the housing outside the cylinder portion to a location  
inside the cylinder portion; and

an object coupled to a portion of the rod outside of the housing, the object being  
moved in response to movement of the piston.

9. (Currently Amended) The ~~actuator device~~ actuating system of Claim 8, further  
comprising a valve selectively fluidly connecting the location inside the cylinder portion and the  
location in the housing outside the cylinder portion.

10. (Currently Amended) The ~~actuator device~~ actuating system of Claim 9, wherein  
the valve selectively fluidly connects the location inside the cylinder portion and the location in  
the housing outside the cylinder portion to vent the air pressure from the cylinder portion.

11. (Currently Amended) The ~~actuator device~~ actuating system of Claim 9, wherein the valve comprises a solenoid valve selectively actuated by an electrical power source.

12. (Currently Amended) The ~~actuator device~~ actuating system of Claim 11, further comprising a switch selectively electrically connecting the solenoid valve and the power source.

13. (Currently Amended) The ~~actuator device~~ actuating system of Claim 8, further comprising

a main power switch electrically connected with a power source; and  
a limit switch positioned within the housing adjacent the piston such that selective movement of the piston triggers the limit switch, the limit switch selectively electrically connecting the air compressor and the main power switch, wherein the main power switch selectively electrically connects the air compressor and the power source to operate the air compressor.

14. (Original) The actuating system of Claim 8, wherein the object includes a lever for a clutch/brake assembly, wherein actuation of the lever causes engagement and disengagement of the clutch/brake assembly, and wherein the rod is coupled to the lever to engage and disengage the clutch/brake assembly in response to movement of the rod.

15. (Original) The actuating system of Claim 14, further comprising a spring coupled between the rod and the lever.

16. (Original) The actuating system of Claim 8, wherein the object includes an idler pulley of a pulley system, wherein the idler pulley is selectively actuated to engage and disengage a belt in the pulley system.

17. (Original) The actuating system of Claim 8, wherein the object includes a powered implement carried by a motorized vehicle.

18. (Original) The actuating system of Claim 17, wherein the implement includes a mower deck carried by a riding lawnmower, and wherein the actuator device is configured to raise and lower the mower deck relative to a mowing surface traveled by the riding lawnmower.

19. (Original) An actuating system comprising:

an actuator device including

a housing,

a piston coupled to the housing by a flexible membrane, the flexible membrane dividing the housing into a first chamber and a second chamber fluidly separated from the first chamber, the piston being responsive to an accumulation of air pressure within the housing,

a rod coupled to the piston for movement with the piston, the rod at least partially extending outside of the housing,

an air compressor fluidly connected with the first chamber of the housing, the air compressor being operable to generate the air pressure within the first chamber of the housing, and

a valve selectively fluidly connecting the first chamber and a location outside of the housing to vent the air pressure from the first chamber; and

an object coupled to a portion of the rod outside of the housing, the object being moved in response to movement of the piston.

20. (Original) The actuating system of Claim 19, wherein the valve comprises a solenoid valve selectively actuated by an electrical power source.

21. (Original) The actuating system of Claim 20, further comprising a switch selectively electrically connecting the solenoid valve and the power source.

22. (Original) The actuating system of Claim 19, further comprising:
  - a main power switch electrically connected with a power source; and
  - a limit switch positioned adjacent the piston such that selective movement of the piston triggers the limit switch, the limit switch selectively electrically connecting the air compressor and the main power switch, wherein the main power switch selectively electrically connects the air compressor and the power source to operate the air compressor.
23. (Original) The actuating system of Claim 19, wherein the object includes a lever for a clutch/brake assembly, wherein actuation of the lever causes engagement and disengagement of the clutch/brake assembly, and wherein the rod is coupled to the lever to engage and disengage the clutch/brake assembly in response to movement of the rod.
24. (Original) The actuating system of Claim 23, further comprising a spring coupled between the rod and the lever.
25. (Original) The actuating system of Claim 19, wherein the object includes an idler pulley of a pulley system, wherein the idler pulley is selectively actuated to engage and disengage a belt in the pulley system.
26. (Original) The actuating system of Claim 19, wherein the object includes a powered implement carried by a motorized vehicle.

27. (Original) The actuating system of Claim 26, wherein the implement includes a mower deck carried by a riding lawnmower, and wherein the actuator device is configured to raise and lower the mower deck relative to a mowing surface traveled by the riding lawnmower.

28. (New) A self-contained actuator device adapted to move an object, the actuator device comprising:

a housing including a cylinder portion, the cylinder portion defining a longitudinal axis;

a piston positioned in the cylinder portion and movable along the longitudinal axis in response to a pressure differential in the housing;

a rod coupled to the piston for movement with the piston, the rod at least partially extending outside of the housing to couple to the object; and

a pump located within the housing and operable to generate the pressure differential in the housing.

29. (New) The actuator device of Claim 28, wherein the pressure differential in the housing includes a higher pressure in the cylinder portion of the housing than in a remaining portion of the housing.

30. (New) The actuator device of Claim 28, wherein the housing is substantially sealed.

31. (New) The actuator device of Claim 28, further comprising a passageway fluidly connecting the pump and the cylinder portion, wherein the passageway is molded into the housing.

32. (New) The actuator device of Claim 28, further comprising a valve selectively fluidly connecting a location inside the cylinder portion and a location in the housing outside the cylinder portion.

33. (New) The actuator device of Claim 28, further comprising at least two electrical terminals coupled to the housing, wherein power is delivered to the pump through the electrical terminals.

34. (New) An actuating system comprising:
- a self-contained actuator device including
- a housing including a cylinder portion, the cylinder portion defining a longitudinal axis;
- a piston positioned in the cylinder portion and movable along the longitudinal axis in response to a pressure differential in the housing;
- a rod coupled to the piston for movement with the piston, the rod at least partially extending outside of the housing; and
- a pump located within the housing and operable to generate the pressure differential in the housing; and
- an object coupled to a portion of the rod outside of the housing, the object being moved in response to movement of the piston.

35. (New) The actuating system of Claim 34, wherein the pressure differential in the housing includes a higher pressure in the cylinder portion of the housing than in a remaining portion of the housing.

36. (New) The actuating system of Claim 34, wherein the housing is substantially sealed.

37. (New) The actuating system of Claim 34, further comprising a passageway fluidly connecting the pump and the cylinder portion, wherein the passageway is molded into the housing.

38. (New) The actuating system of Claim 34, further comprising a valve selectively fluidly connecting a location inside the cylinder portion and a location in the housing outside the cylinder portion.

39. (New) The actuating system of Claim 34, further comprising at least two electrical terminals coupled to the housing, wherein power is delivered to the pump through the electrical terminals.

40. (New) The actuating system of Claim 34, wherein the object includes a lever for a clutch/brake assembly, wherein actuation of the lever causes engagement and disengagement of the clutch/brake assembly, and wherein the rod is coupled to the lever to engage and disengage the clutch/brake assembly in response to movement of the rod.

41. (New) The actuating system of Claim 40, further comprising a spring coupled between the rod and the lever.

42. (New) The actuating system of Claim 34, wherein the object includes an idler pulley of a pulley system, wherein the idler pulley is selectively actuated to engage and disengage a belt in the pulley system.

43. (New) The actuating system of Claim 34, wherein the object includes a powered implement carried by a motorized vehicle.

44. (New) The actuating system of Claim 43, wherein the implement includes a mower deck carried by a riding lawnmower, and wherein the actuator device is configured to raise and lower the mower deck relative to a mowing surface traveled by the riding lawnmower.

45. (New) An actuating system comprising:
- an actuator device including
- a housing;
- a piston coupled to the housing by a flexible membrane, the flexible membrane dividing the housing into a first chamber and a second chamber fluidly separated from the first chamber, the piston being responsive to a pressure differential in the housing;
- a rod coupled to the piston for movement with the piston, the rod at least partially extending outside of the housing;
- a pump fluidly connected with the first chamber of the housing and operable to generate the pressure differential in the housing; and
- a valve selectively fluidly connecting the first chamber and a location outside of the housing; and
- an object coupled to a portion of the rod outside of the housing, the object being moved in response to movement of the piston.

46. (New) The actuating system of Claim 45, wherein the pressure differential in the housing includes a higher pressure in the first portion of the housing than in the second portion of the housing.

47. (New) The actuating system of Claim 45, wherein the object includes a lever for a clutch/brake assembly, wherein actuation of the lever causes engagement and disengagement of the clutch/brake assembly, and wherein the rod is coupled to the lever to engage and disengage the clutch/brake assembly in response to movement of the rod.

48. (New) The actuating system of Claim 47, further comprising a spring coupled between the rod and the lever.

49. (New) The actuating system of Claim 45, wherein the object includes an idler pulley of a pulley system, wherein the idler pulley is selectively actuated to engage and disengage a belt in the pulley system.

50. (New) The actuating system of Claim 45, wherein the object includes a powered implement carried by a motorized vehicle.

51. (New) The actuating system of Claim 50, wherein the implement includes a mower deck carried by a riding lawnmower, and wherein the actuator device is configured to raise and lower the mower deck relative to a mowing surface traveled by the riding lawnmower.
